Abstract. The study presents data on the diversity of grass species in the region of the village of Mugla (the Western Rhodopes). One hundred forty-one species of higher plants belonging to 40 families were registered. (Apiaceae, Aspleniaceae, Asteraceae, Boraginaceae, Brassicaceae, Campanulaceae, Caryophyllaceae, Cistaceae, Cyperaceae, Dipsacaceae, Equisetaceae, Ericaceae, Euphorbiaceae, Fabaceae, Gentianaceae, Geraniaceae, Gesneriaceae, Hypericaceae, Juncaceae, Lamiaceae, Lemnaceae, Liliaceae, Linaceae, Menyanthaceae, Oleacea, Onagraceae, Orchidaceae, Parnassiaceae, Plantaginaceae, Plumbaginaceae, Poaceae, Polygalaceae, Primulaceae, Ranunculaceae, Rosaceae, Rubiaceae, Saxifragaceae, Scrophulariaceae, Valerianaceae and Violaceae). Their conservation status was presented, as well as medicinal plants.

Key words: Mugla, Western Rhodopes, higher plants, conservation status.

Introduction

The Rhodope Mountains are located in the central part of the Balkan Peninsula and they have a total area of 18000 km², over 14000 km² of them being in the territory of the Republic of Bulgaria. Morphographically they are divided into two major parts – the Western and the Eastern Rhodopes Mts. The border between them runs along the river Kayaliyka, Kitka saddle, the Valley of Borovitsa River, the eastern slopes of Zhalty Dyal Hill and reaches the saddle Tri Kamaka, southwest of Zlatograd Town ([BRAMBAROV, 2001](#)).

The Western Rhodope Mountains are the higher part of the mountain massif. They are of a medium mountain type, with a highly indented, thick and deeply incised river network. The average altitude of this part of the mountains is 1150 meters. The

Western Rhodopes Mts. are divided into two parts along the Valley of Vacha River: Batak-Dabrova and Perelik-Prespa. The major peaks in the Perelik-Prespa part are Perelik, Prespa and Chernatitsa Peaks. The highest peak of the Rhodopes is in the Perelik Peak, named "Golyam Perelik" Peak (2 191 m). A large number of tributaries of the rivers Vacha, Chepelarska and Arda rise in that part of the Rhodopes. Smolyan and Hvoyna Valleys are also located in that part of the Western Rhodopes Mts. They fall in the Southern Bulgarian mountain-and-valley region, sub-region of the Western Rhodopes Mts. ([PETROV, 1997](#)).

Materials and Methods

According to the administrative division of the Republic of Bulgaria, the studied area includes the territories of the

Study of Plant Species Composition of Grasslands in Mugla Village Region...

villages of Mugla and Chamla, a small part of the villages of Gela, Gyovren and Trigrad and Nastan quarter of the town of Devin (the border areas with the village of Mugla). Administratively they all belong to the municipalities of Smolyan and Devin Towns, Smolyan District. Smolyan District belongs to South Central region of Bulgaria according to the National Plan for Regional Development (Fig. 1). Inventory of the grass

plants was carried out from June to October 2015. A routing method with transect transitions was used. Transects were selected according to the specificities of different floristic groups, peculiarities of the terrain and altitude, aiming to cover maximum area and all typical and representative of the floristic diversity areas from the studied territory (Table 1). A GPS receiver GARMIN530 was used for inspection of the localities.

The nomenclature follows [DELIPAVLOV & CHESHMEDJIEV \(2003\)](#). Localization and characterization of taxa populations with conservation status was carried out parallel to the route research.

Results and Discussion

One hundred forty-one plant species belonging to 40 families were found during the field inventory of the area (Apiaceae, Aspleniaceae, Asteraceae, Boraginaceae, Brassicaceae, Campanulaceae, Caryophyllaceae, Cistaceae, Cupressaceae, Cyperaceae, Dipsacaceae, Equisetaceae, Ericaceae, Euphorbiaceae, Fabaceae, Gentianaceae, Geraniaceae, Gesneriaceae, Hypericaceae, Juncaceae, Lamiaceae, Lemnaceae, Liliaceae, Menyanthaceae, Oleacea, Onagraceae, Orchidaceae, Parnassiaceae, Plantaginaceae, Plumbaginaceae, Poaceae, Polygalaceae, Primulaceae, Ranunculaceae, Rosaceae, Rubiaceae, Saxifragaceae, Scrophulariaceae, Valerianaceae and Violaceae). The full list of the plants is presented in Table 2.

Figure 2 shows that out of the 141 identified species, Asteraceae family is represented by the richest species diversity (18 species), followed by Lamiaceae family (13 species). Caryophyllaceae and Fabaceae families are represented by 9 species each and Rosaceae and Poaceae – by 8 species each. The rest of the families are under-represented.

Medicinal plants and species with conservation status

Seventy-five (50,34%) of all the 141 described plants are under a special regime (Table 3). 64 species are included in the [Medicinal Plants Act \(2000\)](#), which provides various activities for their conservation and sustainable use, including the collection and buy-out of herbs obtained thereof.

Eight species are included in the [Biological Diversity Act \(2002\)](#). Two of them (*Carex limosa* and *Menyanthes trifoliata*) belong to Annex 2a of the Act and it is stated that the conservation of their habitats is intended by designating protected areas. Five species (*Cortusa matthioli*, *Gentiana lutea* ssp. *sympyandra*, *Geum rhodopaeum*, *Haberlea rhodopensis* and *Potentilla palustris*) are

included in Annex 3 of the same Act and they are announced protected on the territory of the whole country. *Primula veris* species is included in Annex 4 of the Biological Diversity Act under a regime of protection and of regulated use from nature.

There are 4 protected species included in the Red Book of the Republic of Bulgaria, Volume 1. Plants and fungi ([PEEV et al., 2015](#)) – *Carex limosa*, *Gentiana lutea* ssp. *sympyandra*, *Menyanthes trifoliata* and *Sideritis scardica*. They all fall in the category Endangered (EN).

The Red List of Bulgarian vascular plants ([PETROVA & VLADIMIROV, 2009](#)) includes 12 species. *Gentianella praecox* species is included under the category Data Deficient (DD). *Haberlea rhodopensis* is under the category Least Concern (LC), the species *Geum rhodopaeum*, *Jasione bulgarica* and *Saxifraga stibryni* are under Near Threatened (NT) category. Three species: *Angelica paničićii*, *Cortusa matthioli* and *Potentilla palustris* and under Vulnerable (VU) and *Carex limosa*, *Gentiana lutea* ssp. *sympyandra*, *Menyanthes trifoliata* and *Sideritis scardica* are Endangered (EN).

Haberlea rhodopensis is included in Appendix 1 “Strictly protected flora species” of the Convention on the Conservation of European Wildlife and Natural Habitats ([CEST, 1979](#)).

Seventeen of the species described in the studied area are included in the Red List of Threatened Plants of the International Union for Conservation of Nature ([IUCN, 2015](#)). 16 of them – *Caltha palustris*, *Carex limosa*, *Dactylorhiza cordigera*, *Dactylorhiza sambucina*, *Equisetum palustre*, *Filipendula ulmaria*, *Haberlea rhodopensis*, *Juniperus communis*, *Lemna minor*, *Mentha longifolia*, *Menyanthes trifoliata*, *Nasturtium officinale*, *Parnassia palustris*, *Potentilla palustris*, *Scirpus sylvaticus* and *Trifolium pratense* – are under the category of Least Concern (LC), and the species *Sideritis scardica* – under Near Threatened (NT).

The endemic plants listed in the “Atlas of Bulgarian Endemic Plants” ([PETROVA, 2006](#)) are 7. Those are the species *Geum rhodopaeum*, *Jasione bulgarica*, *Sideritis scardica*, *Saxifraga stibryni*, *Haberlea*

Study of Plant Species Composition of Grasslands in Mugla Village Region...

rhodopensis, *Armeria rumelica* and *Chamaecytisus absinthioides*.

Balkan endemics in the Bulgarian flora (PETROVA & VLADIMIROV, 2010) are: *Achillea ageratifolia*, *Chamaecytisus calcareus*, *Pastinaca*

hirsute, *Cirsium appendiculatum* and *Knautia midzorensis*. The species *Haberlea rhodopensis* is also a Tertiary relict and the species *Cortusa matthioli*, *Gymnadenia conopsea* and *Parnassia palustris* are glacial relicts.

75.	<i>Viola tricolor</i>	-	-	-	-	+

Conclusions

In the present study was found a high abundance of plants in all investigated territories. This could be a hallmark for their importance of environmental issues. The list of plants includes 141 species, 24 of them being of conservation importance. Phytocenological studies including species variety and quantity should be carried out in order to determine more detailed characteristics of the areas. This would be of great importance to be done for species with conservation significance.
