

THE MEDITERRANEAN LEAF BEETLES IN BULGARIA (INSECTA: COLEOPTERA: CHRYSOMELIDAE)

Blagoy A. Gruev
*Department of Zoology, University of Plovdiv,
Tzar Assen 24, 4000 Plovdiv, Bulgaria*

ABSTRACT. The Mediterranean leaf beetle species, distributed in Bulgaria, are listed, mapped and zoogeographically classified. Distributional and bionomical data of the species in the whole their geographical area are given.

KEY WORDS. Chrysomelidae, Bulgaria, Mediterranean species.

INTRODUCTION

The Mediterranean species of *Chrysomelidae*, established in Bulgaria, are 9: *Criocerinae* – 1, *Clytrinae* – 1, *Eumolpinae* – 1, *Alticinae* – 5 and *Hispaniae* – 1. This number constitutes about 2 % of the Bulgarian leaf beetle species and subspecies. The distributional data about the taxa in Bulgaria are illustrated by UTM maps with the biogeographical regions and subregions (maps from 1 to 10). The present-day valid locality names are given in square brackets, and at that some of the previously erroneously recorded locality data, are herein corrected.

Acknowledgements. I thank the Master of Biology MIHAIL KECHEV of the University of Plovdiv for the assemblage of the Bulgarian biogeographical division map on a grid map.

This species, described from South Europe, occurs the Mediterranean from Portugal and Morocco to West Turkey. It had been considered by the chrysomelidologists as a west-mediterranean species. Herein however it has to be classified as a member of the Holomediterranean element to the Mediterranean faunistic complex in Bulgaria. The localities in the country lie in the Struma- Mesta subregion of the South-Bulgarian biogeographic region according to the biogeographical division of the country by GRUEV (1988).

BIONOMY

Crioceris paracanthesis is known from May till October in various parts of its area. (in Bulgaria – in May), on *Asparagus acutifolius*.

This species, described from South Europe, is spread from Spain and Algeria to Turkey and Syria. In Bulgaria it was recorded from the Struma-Mesta subregion, the Low Maritsa-Low Tundzha subregion and Strandzha subregion of the South-Bulgarian (with transitional-mediterranean climate) biogeographical region, the Upper Thrace subregion of the Middle-Bulgarian (with transitional-continental climate) biogeographical region and the Black Sea (with maritime climate) biogeographical region. It was classified as a Mediterranean species in Bulgaria by TOMOV (1970). Zoogeographically the species belongs to the Holomediterranean element of the Mediterranean faunistic complex.

BIONOMY

Macroles dentipes has been found from May till August (in Bulgaria – in May, June and July) in various parts of its area, on *Quercus* spp. In Bulgaria it was found on *Quercus pubescens*, *Q. conferta* and *Salix alba*.

Longitarsus corynthius s. l. occurs the Mediterranean and Submediterranean zones. It is a polytypic species: the eastmediterranean sbsp. *corynthius* is distributed in the localities pointed above; the sbsp. *metallescens* – in South Croatia, France, Italy (incl. Sardinia and Sicily), Malta and Spain, and the sbsp. *multipunctatus* – in North Africa [Algeria, Morocco and Tunisia]). *L. corynthius* s. str. is known in Bulgaria from the Struma-Mesta subregion, Lower Maritsa-Lower Tundzha subregion and Strandzha subregion of the South-Bulgarian biogeographical region, submountainous parts below the Vitosha-Ihtiman subregion of the Mountainous biogeographical region, and the Black Sea biogeographical region; with transitional – mediterranean, transitional - continental and maritime climate. It was classified as a member of the East-Mediterranean element of the Mediterranean faunistic complex (GRUEV and BECHEV, 2000).

BIONOMY

L. corynthius s. l. has been established from March till September in various parts of its area, on species of *Boraginaceae*. In Bulgaria sbsp. *corynthius* was found on *Echium italicum*.

Phyllotreta variipennis is a polytypic species. Its nominate form is distributed around the whole Mediterranean Sea (partly in the Submediterranean zone), and the subspecies *aegyptiaca* Pic, 1915 – in Saudi Arabia, Algeria, Libya, Aegypt, Sudan, Chad, Senegal, Canary Islands. In Bulgaria *Phyllotreta variipennis* s. str. was established in the Lower Maritsa-Lower Tundzha subregion of the South-Bulgarian biogeographic region (transitional-mediterranean climate). Zooogeographically the species belongs to the Holomediterranean element of the Mediterranean faunistic complex (GRUEV and BECHEV, 2000)

BIONOMY

The species is known from January till December in various parts of its area (in Bulgaria – in August), on many species of *Brassicaceae*, and also on *Reseda* and *Capparis*. In Bulgaria host plants have not been recorded.

Psylliodes pallidicolor is distributed mainly in the mediterranean and partly in the submediterranean and moderate-continental climatic zones of Europe, Asia and Africa. It is a member of the Holomediterranean element of the Mediterranean faunistic complex in Bulgaria (GRUEV and BECHEV, 2000). Its localities, marked by now, lie in the Struma-Mesta subregion and the Strandzha subregion of the South-Bulgarian biogeographical region, the Upper Struma subregion of the Middle-Bulgarian biogeographical region, the Fore-Balkan subregion of the North-Bulgarian biogeographical region, and in the Black Sea biogeographic regions with transitional-mediterranean, transitional-continental, moderate-continental and maritime climate.

BIONOMY

The species has been found from May till August in its area, including in Bulgaria. Host plants are not known.

The species occurs mainly the Mediterranean and partly the Submediterranean zones of Europe and Africa. In Bulgaria it was found in the Upper –Thrace subregion of the Middle-Bulgarian biogeographical region (with transitional-continental climate) and the Black Sea (with maritime climate) biogeographical region, and was classified as a member of the Holomediterranean element of the Mediterranean faunistic complex (GRUEV, 1988).

BIONOMY

Known from April till June (in Bulgaria – June) in its area, on *Centaurea*, *Apocynum*, *Oenothera* and spp. of *Poaceae* (*Ammophila*, *Calagrostis*, *Stipa*). In Bulgaria host plants have not been established.

Dicladispa testacea occurs mainly the Mediterranean and partly the Submediterranean zones. In Bulgaria it was found in the Strandzha subregion of the South-Bulgarian (with transitional-mediterranean climate) biogeographical region and the Black Sea biogeographical region, and was classified as a member of the Holomediterranean element of the Mediterranean faunistic complex in Bulgaria (GRUEV, 1980; GRUEV and BECHEV, 2000)

BIONOMY

The species has been found from April till November in various parts of its area, on *Cistus* spp. In Bulgaria it is known from May to June, on *Cistus salvifolius*

ZOOGEOGRAPHY

The Mediterranean *Chrysomelidae* taxa in Bulgaria belong to two elements of the Mediterranean faunistic complex: Holomediterranean (*Crioceris paracenthes*, *Macrolenes dentipes*, *Phyllotreta variipennis*, *Psylliodes pallidicolor*, *P. puncticollis*, *Dicladispa testacea*) and East-Mediterranean (*Colaspidea grandis*, *Longitarsus corynthus* s. str., *Phyllotreta pontoaegeica*). They inhabit the parts of the country, which are influenced by the mediterranean climate (see the maps).

All the very Mediterranean species are stenochoric and stenotopic relict forms without possibilities for an expansion beyond the Mediterranean and Transitional-Mediterranean (Submediterranean) zones (GRUEV, 1990 a). As for the Mediterranean leaf beetles, their distribution depends of their mediterranean food plants (*Crioceris paracanthesis* – of *Asparagus acutifolius*; *Dicladispa testacea* – of *Cistus* spp; etc.). A definitive factor for their distribution is however the climate. A good illustration is for example the distribution of the species *Phyllotreta variipennis*. Some of its food plants of *Brassicaceae* occur a very large area out of the Mediterranean region (*Sinapis arvensis* and *Brassica oleracea* are cosmopolites; *Sisymbrium officinale* – Europe and Siberia, and others). In spite of that the area of *Phyllotreta variipennis* however is not spread but of the Mediterranean and Submediterranean climatic zones.

Remarks. Five taxa, classified previously by the author as members of the Mediterranean faunistic complex in Bulgaria, have to be taken out of the Mediterranean species list in the country: *Cryptocephalus prusias* Suffrian, 1853 (Bosnia-Herzegovina, Bulgaria, Syria, Jordan; recently it was established that the species occurs also Asiatic Turkey and Armenia) *Chrysolina grossa* (Fabricius, 1792) (recorded to the fauna of Bulgaria on the basis of a false label: „Plovdiv“), *Aphthona bonvouloiri* Allard, 1869 (Sicily, East Bulgaria: Emineh Balkan; European and West Asiatic Turkey, Rhodos, Syria, Lebanon, Israel; recently established in East Turkey: Erzurum District, 1600-1850 m, and in North-West Iran: Horasan), *Mantura cylindrica* Miller, 1880 (Croatia [Dalmatia, incl. the Adriatic Isls]; Greece [incl. Crete and Zakynthos], Italy [incl. Sicily], Asiatic Turkey; recently established in Azerbaijan and Syria, and confirmed from Caucasus), and *Neocrepidodera impressa obtusangula* (J. Daniel, 1904) (Bulgaria: Black Sea area; Greece: incl. Crete, South Sporades, Is. Lesbos, Kyklades; Cyprus; recently recorded from East Turkey: Erzurum Distr., 1600 m).

Undoubtedly the species *Cryptocephalus prusias*, *Aphthona bonvouloiri*, *Mantura cylindrica* and *Neocrepidodera* (? sp.) *obtusangula* have Asiatic origin and they have to be added to the Southwest-Asiatic faunistic complex (? perhaps to the Subiranian element) in Bulgaria
